Can bidirectional charging transform EVs into mobile energy storage units?

According to the document, "bidirectional charging has the potential to transform EVs into mobile energy storage units, unlocking substantial value across the energy ecosystem." To help people 'navigate' the complexities of bidirectional charging, the document includes eight so-called one-pagers, looking at the different applications.

What is bidirectional charging?

Bidirectional charging describes the technology of not only charging an electric vehicle from the grid, but also feeding electricity back into the grid or to consumers. This is often referred to as Vehicle-2-Grid (V2G) or Vehicle-2-Home (V2H).

What is bidirectional EV charging?

Bidirectional charging refers to two-way charging (meaning charge and discharge). V2G is a charging technology that allows the one-way flow of energy from the car battery back to the grid (from the vehicle to the grid). Now, the V2G technology makes bidirectional EV chargers a reality, and no one will point fingers if you use both interchangeably.

Does bidirectional storage reduce energy supply costs in Europe?

The bidirectional development of the existing storage capacity in electric vehicles for the energy system reduces the energy supply costs in Europe compared to a scenario without bidirectional electric vehicles. The use as daily storage improves the system integration of renewable energies and PV energy in particular.
