## Container maintenance base station signal

What happens after a signal enhancement is completed in a base station?

After the signal enhancement is completed in the base station, the data packet continues to be transmitted to the processing center. Finally, the data processing center provides better services for users by analyzing these data packets. Fig 1. The framework of the Intelligent Internet of Things.

Does a base station have a queuing problem?

Because the base station has sufficient forwarding capacity, there is no queuing problem in this case, that is, all queuing delays are assumed to be 0. The small-scale case consists of 30 sensing nodes, 32 potential relay nodes, and 1 sink node. Due to practical needs, the threshold of timely reliability  $\gamma$  must be above 0.999999.

Is a base station always reliable?

Thus, we can consider introducing the user classification phenomenon to optimize the service strategy of operators. Finally, in the modeling process, we assume that the base station is always completely reliable, without considering the impact of aging and deliberate attacks on the base station performance.

How to solve the 5 G base station optimization location?

To solve the 5 G base station optimization location considering timely reliability, we propose a novel NDPR model considering the signal strength deterioration and the actual data transmission process in wireless sensor networks, which can provide better service qualities for the users.
