
How big an inverter should I use for home solars

What size solar inverter do I Need?

Your inverter size should match your solar array's capacity, not your electricity bill. This means your inverter doesn't need to power your entire home--it just converts whatever your panels generate. Let's say you have a 6kW solar array (twenty 300-watt panels).

Why is the size of a solar inverter important?

The size of a solar inverter is crucial because it determines how much energy can flow to your home and battery at any given time. More specifically, the inverter ensures that enough energy can flow from your solar panels to the grid and load or if installed with a battery, from and to the battery.

Should I undersize my solar inverter?

Undersizing allows your solar inverter to run closer to its maximum output for more hours during the day, which can improve efficiency. However, if your panels frequently produce more power than the inverter can handle (especially during peak sun hours), the system will clip that excess power--resulting in lost generation.

What does a solar inverter do?

Your solar inverter serves as the translator between your panels and your home's electrical system. Solar panels generate direct current (DC) electricity, but your home runs on alternating current (AC). The inverter handles this crucial conversion, and its size directly impacts your system's efficiency and safety.
