
How to check the ground connection of solar inverter strings

Can a PV inverter be touched?

Touch the cables of the PV array on the insulation only. Do not touch any parts of the substructure or frame of the PV array. Do not connect PV strings with ground faults to the inverter. Ensure that no voltage is present and wait five minutes before touching any parts of the PV system or the product.

How to find a ground fault in a PV string circuit?

wire nut or tape to prevent it from coming and creating a safety hazard. Connect the black test lead to ground. Run the insulation resistance test and record the results. Repeat the test on other conductors in the circuit. If a fault is found, how to locate a ground fault in a PV string circuit by the numbers. A PV string circuit without a ground fault will

How to check a PV system for ground faults?

The exact procedure is described in the following sections. Check the PV system for ground faults by measuring the voltage. If the voltage measurement was not successful, check the PV system via insulation resistance measurement for ground faults. Proceed as follows to check each string in the PV system for ground faults.

How do you know if an inverter has a ground fault?

Measure the remaining strings in the same manner. If the insulation resistance of a string deviates considerably from the theoretically calculated value, there is a ground fault present in that string. Reconnect to the inverter only those strings from which the ground fault has been eliminated. Reconnect all other strings to the inverter.
