## Liquid flow battery specific capacity

What is the volume specific capacity of flow batteries?

It can be seen that the volume specific capacity of traditional flow batteries using only liquid redox active substances is generally low, only no more than 25 Ah L<sup>-1</sup>, while in this work, a high volume specific capacity of 60 Ah L<sup>-1</sup> can be reached.

What is a flow battery?

A flow battery is an electrochemical battery, which uses liquid electrolytes stored in two tanks as its active energy storage component.

What are the characteristics and benefits of flow batteries?

The major characteristic and benefit flow batteries is the decoupling by design of power and energy. Power is determined by the size and number of cells, energy by the amount of electrolyte. Their low energy density makes flow batteries unsuited for mobile or residential applications, but attractive on industrial and utility scale.

What is the energy density of flow biphasic batteries?

The flow biphasic battery displayed higher energy density (33 Wh/L) than those of the earlier reported membrane-free batteries. The peak power densities of the 0.5 M Li||Tri-TEMPO, C3-PTZ, and CP batteries under static conditions are 33, 30, and 37 mW/cm<sup>2</sup>, respectively, at 100% SOC.
