# Solar container inverter is divided into single phase and two phase

What is the difference between single phase and split phase inverters?

Understanding the differences between single phase inverters and split phase inverters is crucial for optimizing your energy setup. Single phase inverters are ideal for smaller loads and basic needs, while split phase inverters provide dual voltage and the capacity to handle heavier appliances and more demanding systems.

How does a single phase solar inverter work?

A single-phase solar inverter and an AC coupled battery. The backup is all on the 'black' phase. When the grid goes down in this configuration the battery system isolates the house from the grid (islands) and keeps 230V on the 'black' phase so the solar inverter does not shut down. The solar panels continue to send power to the house and battery.

Are three-phase solar inverters better than single-phase?

Under the same brand and quality, three-phase inverters usually cost about 300-500 RMB more per unit than single-phase ones. Thus, single-phase inverters are more economical. In neighborhoods with many solar systems, single-phase inverters are more prone to "over-voltage trips."

What is the difference between phase and wire in solar inverters?

Understanding the concepts of "Phase" and "Wire" is crucial in the selection and application of solar inverters. "Phase" refers to the number of live conductors and their phase angle differences, while "Wire" refers to the types of conductors connecting the power source and devices.
