
Solar energy storage investment economics

How much does solar energy storage cost?

Adding solar energy storage typically costs between \$12,000 and \$20,000. For example, a Powerwall battery costs about \$15,500 fully installed by Tesla, whereas a Panasonic EverVolt battery would be closer to \$18,000.

What are the economics of energy storage systems?

The economics of energy storage systems is dependent on the services and markets that exist on the electrical grid. These value streams can vary by region, electrical system, and grid domain (i.e., transmission, distribution, customer-sited).

Do investors underestimate the value of energy storage?

While energy storage is already being deployed to support grids across major power markets, new McKinsey analysis suggests investors often underestimate the value of energy storage in their business cases.

Should energy storage be undervalued?

The revenue potential of energy storage is often undervalued. Investors could adjust their evaluation approach to get a true estimate--improving profitability and supporting sustainability goals.
