How do solar panels generate electricity?

This process is constant. Over 500 million tons of hydrogen atoms are converted into helium every second, resulting in photons that generate solar energy here on Earth. In a nutshell, solar panels generate electricity when photons (those particles of sunlight we discussed before) hit solar cells. The process is called the photovoltaic effect.

How do solar panels work?

They are composed of numerous solar cells made of semiconductor materials, typically silicon, which capture solar energy and convert it into usable electricity. When sunlight hits the surface of these panels, it triggers the photovoltaic effect, which is the process that generates electricity.

What are the different types of solar energy?

Learn about the basics of solar radiation. There are two main types of solar energy technologies--photovoltaics (PV) and concentrating solar-thermal power (CSP). You're likely most familiar with PV, which is utilized in solar panels. When the sun shines onto a solar panel, energy from the sunlight is absorbed by the PV cells in the panel.

What is a typical solar panel system?

A typical solar panel system consists of more than just the panels themselves. To fully understand how solar panels generate electricity, it's helpful to look at the entire system, which includes:
