What happens if you mix different wattages of solar panels?

When you mix different wattages of solar panels, the system operates based on the lowest voltage or amp level. In this way, your efficiency and power output will most likely take a hit. However, it is achievable, provided you pay attention to the properties such as wattage, voltage, amps, and so on. 1. Using series or parallel wiring 2.

How do you wire a solar panel with different wattages?

There are two wiring options when connecting panels with different wattages: series or parallel. Wiring in series means you connect the positive to the negative whereas wiring in parallel means you wire positives together and then wire the negatives together.

How many Watts Does a 4 x 100W solar panel produce?

In the diagram above, 4 x 100w panels, each with a rated voltage of 17.9 and current of 5.72A, wired in series could produce 71.6 volts and 5.72 amps - a total of 409 watts. Note, solar panels' wattage is rated under standard test conditions. So, for example, these 100w panels will provide 100w then but slightly more in colder temperatures.

Can I use different wattage solar panels?

Nevertheless, using different solar panels is doable and can still provide all the energy you need. If you want to learn more about mixing different wattage solar panels, check out our video where Jacob goes further in-depth with how to do so and what to expect when you do.
